

One in two cases of sight loss can be avoided

Will you be the one?

100 people a day in the UK start losing their sight. 50% of sight loss can be avoided with the correct prescription or the right treatment at the appropriate time. With the SPECTRALIS 4D HD eye health check, we can see the smallest change before you do and that changes everything. Earlier detection of serious eye disease allows for earlier treatment and a better outcome for you. Protect your future, book your sight test today.

Focus on your eyesight

Having an annual eye exam is the best way of preventing degenerative eye conditions and vision loss

The majority of the population do not realise that a comprehensive eye health check isn't just about a new pair of spectacles or contact lenses. It can reveal early changes in the eye, of which you may be completely unaware.

A hundred people a day in the UK start losing their sight, but the good news is that one in two cases of sight loss can be avoided with the right treatment at the appropriate time. Early detection of an eye problem often allows for early treatment and an improved quality of life.

Keeping your eyes in check

Diseases like diabetes can impair an individual's vision or even cause permanent vision loss if it isn't caught at an early stage. Glaucoma is known as the 'thief of sight' as it often creeps up on patients without them being aware of it.

A cataract can mask underlying problems in the retina. Age-related macular degeneration (AMD) can also affect your central vision. If it goes unchecked, this condition will prevent you from reading, driving, watching TV and even recognising your family and friends' faces as you grow older. The best preventative measure an individual can take to protect their eyes is to

Simulation of vision impairment due to wet age-related macular degeneration

Normal vision

have an annual examination. SPECTRALIS 4D HD imaging technology identifies and monitors the smallest change. This can change everything.

The SPECTRALIS 4D HD Eye Health Check, uses a patented eye-tracking system that produces three dimensional images of the eye, allowing your eyecare professional to more easily identify if you are at risk of eye disease. The tracking system allows the scan to be placed in exactly

the same place on every visit, giving a true 4D view of change over time. This helps reveal eye disease which may not yet be noticeable by you or detectable with a traditional sight test.

The best test for you

The SPECTRALIS 4D HD Eye Health Check is fast, non-contact and does not present you with a bright flash of light or a puff of air. You simply sit in front of the instrument and your eye is then scanned in the space of a few seconds.

Early detection and close monitoring of change can limit the severity of disease. This can help to ensure both fast referral and individualised treatment for the best results.
